December 18, 1973

RE: The Metric System and Conversion Factors

This Range Technical Note transmits tables of comparisons by Durwood E. Ball on the use of the metric system. Many technical papers use the metric system. These factors will be useful in conversion.

THE METRIC SYSTEM CONVERSION FACTORS

Durwood E. Ball, Range Conservationist

In recent years, most technical publications use the metric system as a standard mean of expressing measurements. In using the metric system, some long standing maxims would take on a different look.

"A miss is as good as 1.6093 kilometers."

"I wouldn't touch it with a 3.048 meter pole."

"Texans wear 37.853 liter hats."

"God's little .4047 hectare."

"28.35 grams of prevention is worth 453.6 grams of cure."

"Give 2.54 centimeters and they'll take 1.6093 kilometers."

It appears that in time the metric system will be accepted as the standard system of measurement. It is a simple, easy to use system. The difficulty most people experience is using one system of measurement and occasionally relating it to a different system. As leaders in our technical fields, we need to be capable of working within the metric system and making conversions when necessary. The following will provide information about the metric system and some conversion tables.

The conversion factors and tables for English and Metric units contained in this article come from varied sources:

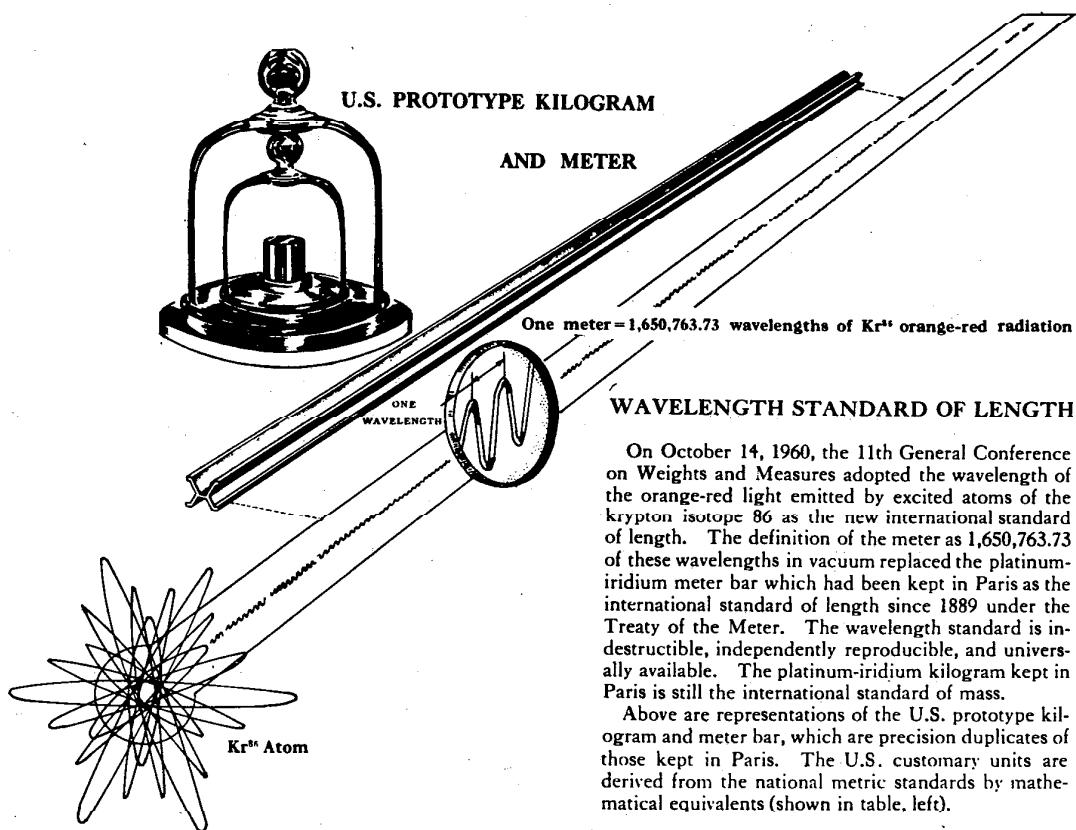

1. Federal Register - July 1, 1959 - (National Bureau of Standards Miscellaneous Publication-233).
2. Soil Science Society Proceedings
3. American Instrument Company - September 1951 - (Reprinted by courtesy of Albert Sauveur).
4. E. William Anderson, Oregon State SCS Technical Note - September 1972.
5. Personal assistance of Gary Margheim, Engineer, SCS, Portland, Oregon.

THE METRIC SYSTEM

The metric system comprises the meter as the unit of length and the kilogram as the unit of mass. The unit of fluid capacity, the liter, is the volume of one kilogram of water and is approximately equal to 1/1000 of a cubic meter. All other metric units are the decimal subdivisions or multiples of these three basic units, and are named according to the table of prefixes below.

In conjunction with the metric system the Celsius temperature scale is used and the second is taken as the unit of time. The temperature scale is defined by certain fixed points. The second is defined as 1/31,556,925.9747 of the tropical year 1900 (approximately 1/86,400 of the average day) and is determined by astronomical observation.

Responsibility for the preservation and promotion of the metric system is centered at the International Bureau of Weights and Measures, at Sèvres, France, which was established under the terms of the Treaty of the Meter of 1875. The United States is an adherent to the Treaty of the Meter.

On October 14, 1960, the 11th General Conference on Weights and Measures adopted the wavelength of the orange-red light emitted by excited atoms of the krypton isotope 86 as the new international standard of length. The definition of the meter as 1,650,763.73 of these wavelengths in vacuum replaced the platinum-iridium meter bar which had been kept in Paris as the international standard of length since 1889 under the Treaty of the Meter. The wavelength standard is indestructible, independently reproducible, and universally available. The platinum-iridium kilogram kept in Paris is still the international standard of mass.

Above are representations of the U.S. prototype kilogram and meter bar, which are precision duplicates of those kept in Paris. The U.S. customary units are derived from the national metric standards by mathematical equivalents (shown in table, left).

TEMPERATURE

Celsius, C (centigrade)

$$\frac{9}{5}^{\circ}\text{C} + 32$$

Fahrenheit, F

$$\frac{5}{9}^{\circ}\text{F} - 32$$

The center figure is the temperature to be converted to either Centigrade or Fahrenheit. The left column is the equivalent degrees in centigrade and the right column is the equivalent degrees in Fahrenheit.

For example:
To convert 0°C to $^{\circ}\text{F}$, find 0° in the center column and read the degrees $^{\circ}\text{F}$ in the right hand column. To convert 32°F to $^{\circ}\text{C}$, find 32° in the center column and read the degrees $^{\circ}\text{C}$ in the left hand column.
